# Relational Model

---

- Relation

- A **relation**  $R$  with **attributes**  $A = \{A_1, A_2, \dots, A_n\}$  defined over  $n$  **domains**  $D = \{D_1, D_2, \dots, D_n\}$  (not necessarily distinct) with values  $\{Dom_1, Dom_2, \dots, Dom_n\}$  is a **finite, time varying** set of  $n$ -tuples  $\langle d_1, d_2, \dots, d_n \rangle$  such that  $d_1 \in Dom_1, d_2 \in Dom_2, \dots, d_n \in Dom_n$ , and  $A_1 \subseteq D_1, A_2 \subseteq D_2, \dots, A_n \subseteq D_n$ .
- Notation:  $R(A_1, A_2, \dots, A_n)$  or  $R(A_1: D_1, A_2: D_2, \dots, A_n: D_n)$
- Alternatively, given  $R$  as defined above, an instance of it at a given time is a set of  $n$ -tuples:  
$$\{\langle A_1: d_1, A_2: d_2, \dots, A_n: d_n \rangle \mid d_1 \in Dom_1, d_2 \in Dom_2, \dots, d_n \in Dom_n\}$$

- Tabular structure of data where

- $R$  is the table heading
- Attributes are table columns
- Each tuple is a row

# Relation Schemes and Instances

---

- Relational scheme

- ➔ A **relation scheme** is the definition; i.e., a set of attributes
- ➔ A **relational database scheme** is a set of relation schemes:
  - ◆ i.e., a set of sets of attributes

- Relation instance (*simply relation*)

- ➔ An relation is an instance of a relation scheme
- ➔ a **relation**  $\mathbf{r}$  over a relation scheme  $R = \{A_1, \dots, A_n\}$  is a subset of the Cartesian product of the domains of all attributes, i.e.,

$$\mathbf{r} \subseteq Dom_1 \times Dom_2 \times \dots \times Dom_n$$

# Domains

---

- A domain is a *type* in the programming language sense
  - ➔ Name: String
  - ➔ Salary: Real
- Domain values is a set of acceptable values for a variable of a given type.
  - ➔ Name: CdnNames = {...},
  - ➔ Salary: ProfSalary = {45,000 - 150,000}
  - ➔ Simple/Composite domains
    - ◆ Address = Street name+street number+city+province+ postal code
- Domain compatibility
  - ➔ Binary operations (e.g., comparison to one another, addition, etc.) can be performed on them.
- Full support for domains is not provided in many current relational DBMSs

# Relation Schemes

# What to do?

---

- Take each relation **individually** and “improve” it in terms of the desired characteristics
  - ➔ Normal forms
    - ◆ Atomic values (1NF)
    - ◆ Can be defined according to keys and dependencies.
    - ◆ Functional Dependencies ( 2NF, 3NF, BCNF)
    - ◆ Multivalued dependencies (4NF)
  - ➔ Normalization
    - ◆ Normalization is a process of **concept separation** which applies a top-down methodology for producing a schema by *subsequent refinements and decompositions*.
    - ◆ Do not combine unrelated sets of facts in one table; each relation should contain an independent set of facts.
    - ◆ Universal relation assumption
    - ◆ 1NF to 3NF; 1NF to BCNF

# Normalization Issues

---

- How do we decompose a schema into a desirable normal form?
- What criteria should the decomposed schemas follow in order to preserve the semantics of the original schema?
  - ➔ Reconstructability: recover the original relation  $\Rightarrow$  no spurious joins
  - ➔ Lossless decomposition: no information loss
  - ➔ Dependency preservation: the constraints (i.e., dependencies) that hold on the original relation should be enforceable by means of the constraints (i.e., dependencies) defined on the decomposed relations.
- What happens to queries?
  - ➔ Processing time may increase due to joins
  - ➔ Denormalization

# Functional Dependence

---

- Given relation  $R$  defined over  $U = \{A_1, A_2, \dots, A_n\}$  where  $X \subseteq U, Y \subseteq U$ . If, for **all** pairs of tuples  $t_1$  and  $t_2$  in **any** legal instance of relation scheme  $R$ ,

$$t_1[X] = t_2[X] \Rightarrow t_1[Y] = t_2[Y],$$

then the functional dependency  $X \rightarrow Y$  holds in  $R$ .

- Example

- In relation EMP

- ♦  $(\text{ENO}, \text{PNO}) \rightarrow (\text{ENAME}, \text{TITLE}, \text{SAL}, \text{DUR}, \text{RESP})$

- In relation PROJ

- ♦  $\text{PNO} \rightarrow (\text{PNAME}, \text{BUDGET})$

# Normal Forms Based on FDs

1NF eliminates the relations within relations or relations as attributes of tuples.

## First Normal Form (1NF)

eliminate the **partial** functional dependencies of non-prime attributes to key attributes

Lossless &  
Dependency  
preserving

## Second Normal Form (2NF)

eliminate the **transitive** functional dependencies of non-prime attributes to key attributes

## Third Normal Form (3NF)

eliminate the **partial** and **transitive** functional dependencies of prime (key) attributes to key.

## Boyce-Codd Normal Form (BCNF)

Lossless

# Normalized Relations – Example

# Relational Algebra

---

Specify how to obtain the result using a set of operators

Form

$$\begin{array}{ccc} \langle Operator \rangle_{\langle parameters \rangle} & \langle Operands \rangle & \rightarrow \langle Result \rangle \\ & \downarrow & \downarrow \\ & \text{Relation (s)} & \text{Relation} \end{array}$$

# Relational Algebra Operators

---

- Fundamental

- ➔ Selection
- ➔ Projection
- ➔ Union
- ➔ Set difference
- ➔ Cartesian product

- Additional

- ➔ Intersection
- ➔  $\theta$ -join
- ➔ Natural join
- ➔ Semijoin
- ➔ Division

- Union compatibility

- ➔ Same degree
- ➔ Corresponding attributes defined over the same domain

# Selection

---

- Produces a horizontal subset of the operand relation
- General form

$$\sigma_F(R) = \{t \mid t \in R \text{ and } F(t) \text{ is true}\}$$

where

- $R$  is a relation,  $t$  is a tuple variable
- $F$  is a formula consisting of
  - ♦ operands that are constants or attributes
  - ♦ arithmetic comparison operators

$<, >, =, \neq, \leq, \geq$

- ♦ logical operators

$\wedge, \vee, \neg$

# Selection Example

---

# Projection

---

- Produces a vertical slice of a relation
- General form

$$\Pi_{A_1, \dots, A_n}(R) = \{t[A_1, \dots, A_n] \mid t \in R\}$$

where

- $R$  is a relation,  $t$  is a tuple variable
- $\{A_1, \dots, A_n\}$  is a subset of the attributes of  $R$  over which the projection will be performed
- Note: projection can generate duplicate tuples. Commercial systems (and SQL) allow this and provide
  - Projection with duplicate elimination
  - Projection without duplicate elimination

# Projection Example

---

PROJ

PNO	PNAME	BUDGET
P1	Instrumentation	150000
P2	Database Develop.	135000
P3	CAD/CAM	250000
P4	Maintenance	310000

$\Pi_{\text{PNO}, \text{BUDGET}}(\text{PROJ})$

PNO	BUDGET
P1	150000
P2	135000
P3	250000
P4	310000

# Union

---

- Similar to set union
- General form

$$R \cup S = \{t \mid t \in R \text{ or } t \in S\}$$

where  $R, S$  are relations,  $t$  is a tuple variable

- Result contains tuples that are in  $R$  or in  $S$ , but not both (duplicates removed)
- $R, S$  should be union-compatible

# Set Difference

---

- General Form

$$R - S = \{t \mid t \in R \text{ and } t \notin S\}$$

where  $R$  and  $S$  are relations,  $t$  is a tuple variable

- ➔ Result contains all tuples that are in  $R$ , but not in  $S$ .
- ➔  $R - S \neq S - R$
- ➔  $R, S$  union-compatible

# Cartesian (Cross) Product

---

- Given relations

- ➔  $R$  of degree  $k_1$ , cardinality  $n_1$

- ➔  $S$  of degree  $k_2$ , cardinality  $n_2$

- Cartesian (cross) product:

$$R \times S = \{t [A_1, \dots, A_{k_1}, A_{k_1+1}, \dots, A_{k_1+k_2}] \mid t[A_1, \dots, A_{k_1}] \in R \text{ and } t[A_{k_1+1}, \dots, A_{k_1+k_2}] \in S\}$$

The result of  $R \times S$  is a relation of degree  $(k_1 + k_2)$  and consists of all  $(n_1 * n_2)$ -tuples where each tuple is a concatenation of one tuple of  $R$  with one tuple of  $S$ .

# Cartesian Product Example

# Division (Quotient)

---

- Given relations

- ➔  $R$  of degree  $k_1$  ( $R = \{A_1, \dots, A_{k_1}\}$ )

- ➔  $S$  of degree  $k_2$  ( $S = \{B_1, \dots, B_{k_2}\}$ )

Let  $A = \{A_1, \dots, A_{k_1}\}$  [i.e.,  $R(A)$ ] and  $B = \{B_1, \dots, B_{k_2}\}$  [i.e.,  $S(B)$ ] and  $B \subseteq A$ .

Then,  $T = R \div S$  gives  $T$  of degree  $k_1 - k_2$  [i.e.,  $T(Y)$  where  $Y = A - B$ ] such that for a tuple  $t$  to appear in  $T$ , the values in  $t$  must appear in  $R$  in combination with *every tuple* in  $S$ .

- Derivation

$$R \div S = \Pi_Y(R) - \Pi_Y((\Pi_Y(R) \times S) - R)$$

  - Conditions
    - ♦  $s[A] \theta t[B]$ ;  $s$  and  $t$  are tuple variables,  $A$  and  $B$  are components of  $s$  and  $t$ , respectively,  $\theta \in \{<, >, =, \neq, \leq, \geq\}$ ; e.g.,  $s[\text{SAL}] > t[\text{SAL}]$
    - ♦  $s[A] \theta c$ ;  $s$ ,  $A$ , and  $\theta$  as defined above,  $c$  is a constant; e.g.,  $s[\text{ENAME}] = \text{'Smith'}$
- SQL is an example of tuple relational calculus (at least in its simple form)

# Domain Relational Calculus

- Query of the form  $x_1, x_2, \dots, x_n \mid F(x_1, x_2, \dots, x_n)$  where
  - $F$  is a well-formed formula in which  $x_1, x_2, \dots, x_n$  are the free variables
- QBE is an example

# Computer Network

- An **interconnected** collection of **autonomous** computers that are capable of exchanging information among themselves.
- Components
  - ➔ Hosts (nodes, end systems)
  - ➔ Switches
  - ➔ Communication link

# Internet

- Network of networks

# Types of Networks

---

- According to scale (geographic distribution)
  - ➔ Wide area network (WAN)
    - ◆ Distance between any two nodes  $> 20\text{km}$  and can go as high as thousands of kms
    - ◆ Long delays due to distance traveled
    - ◆ Heterogeneity of transmission media
    - ◆ Speeds of 150Mbps to 10Gbps (OC192 on the backbone)
  - ➔ Local area network (LAN)
    - ◆ Limited in geographic scope (usually  $< 2\text{km}$ )
    - ◆ Speeds 10-1000 Mbps
    - ◆ Short delays and low noise
  - ➔ Metropolitan area network (MAN)
    - ◆ In between LAN and WAN

# Types of Networks (cont'd)

---

- Topology

- ➔ Irregular

- ◆ No regularity in the interconnection – e.g., Internet

- ➔ Bus

- ◆ Typical in LANs – Ethernet

- ◆ Using Carrier Sense Medium Access with Collision Detection (CSMA/CD)

- ✓ Listen before and while you transmit

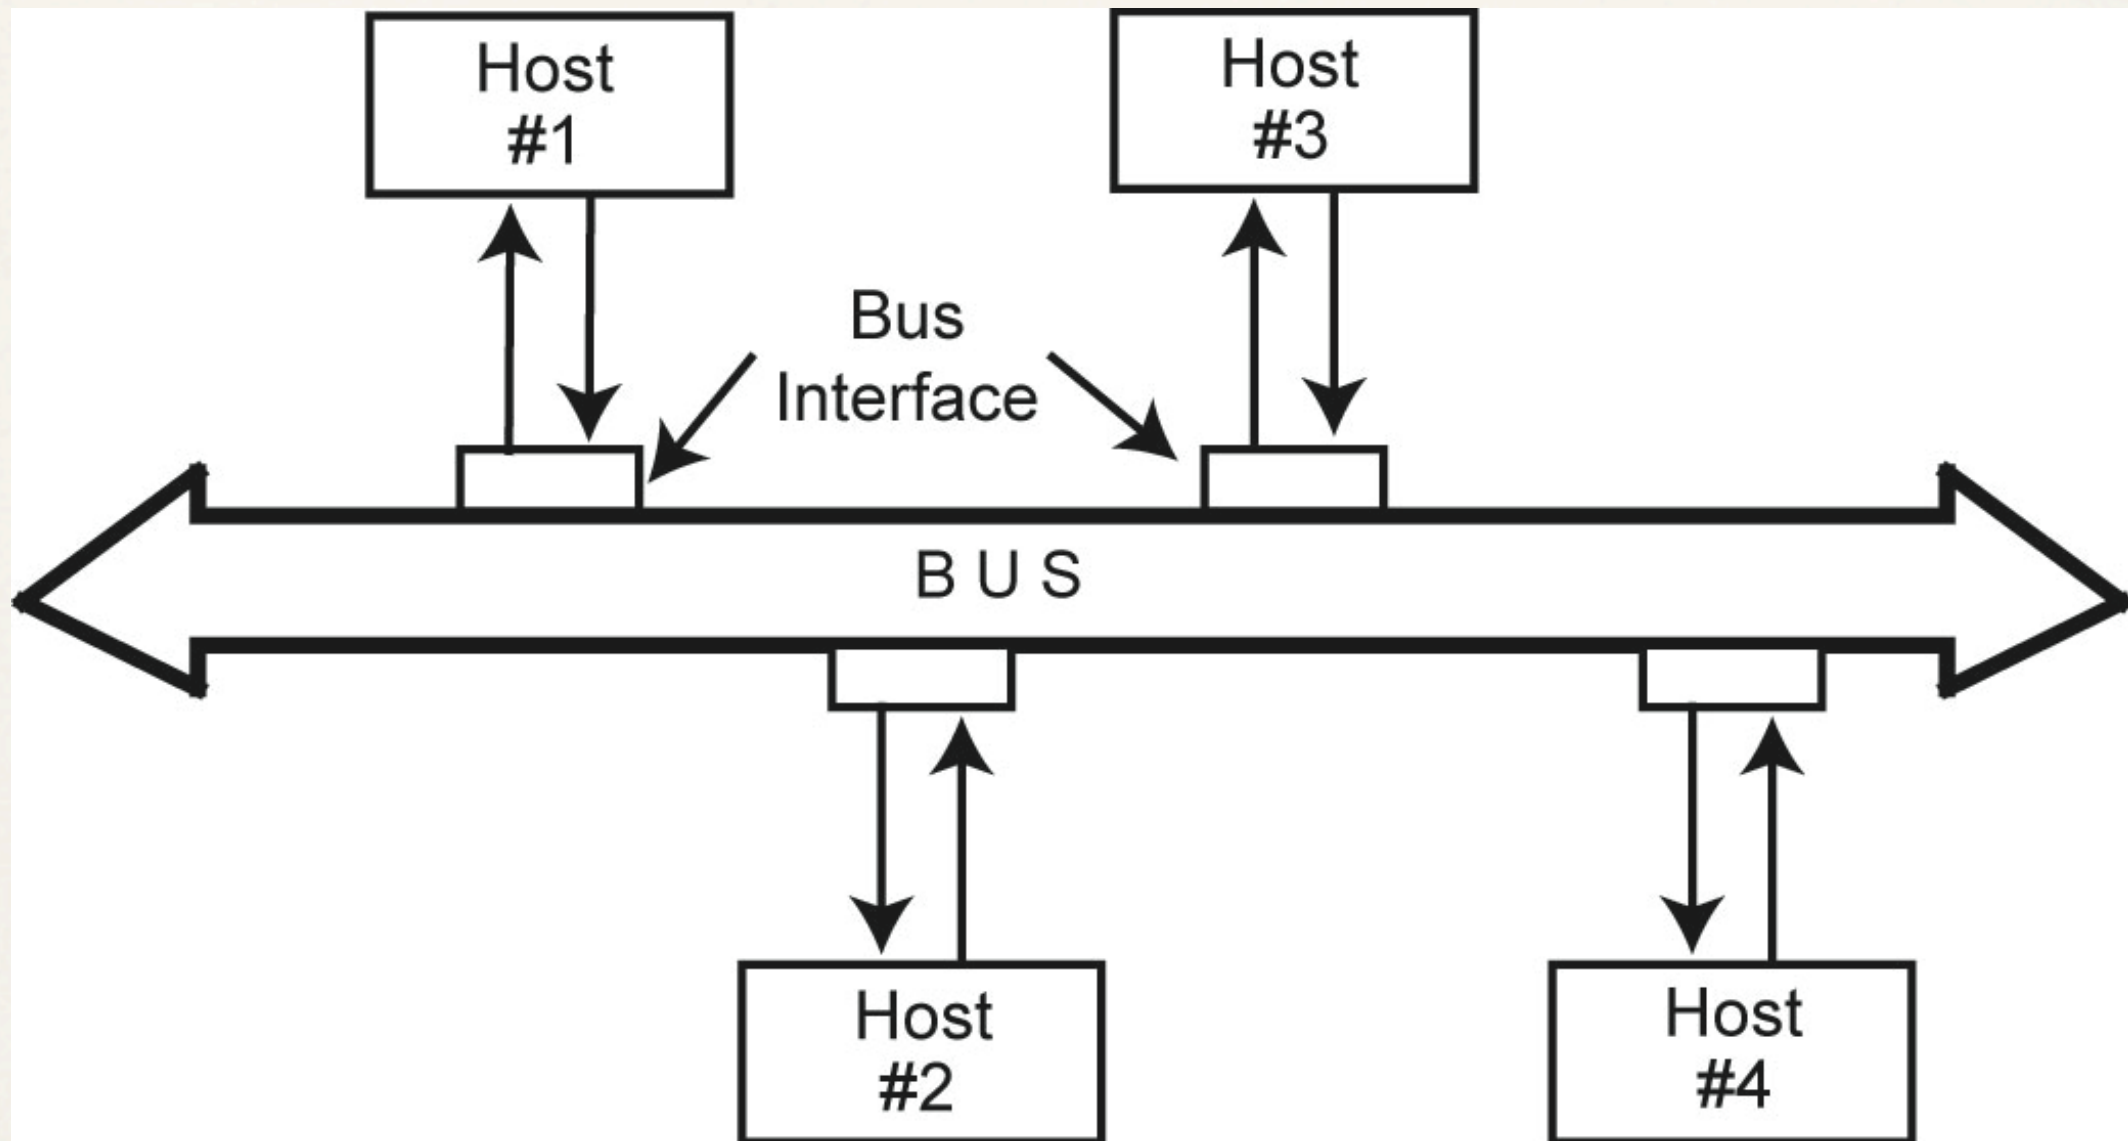

- ➔ Star

- ➔ Ring

- ➔ Mesh

# Bus network

# Communication Schemes

---

- Point-to-point (unicast)
  - ➔ One or more (direct or indirect) links between each pair of nodes
  - ➔ Communication always between two nodes
  - ➔ Receiver and sender are identified by their addresses included in the message header
  - ➔ Message may follow one of many links between the sender and receiver using **switching** or **routing**
- Broadcast (multi-point)
  - ➔ Messages are transmitted over a shared channel and received by all the nodes
  - ➔ Each node checks the address and if it not the intended recipient, ignores
  - ➔ Multi-cast: special case
    - ◆ Message is sent to a subset of the nodes

# Communication Alternatives

---

- Twisted pair
- Coaxial
- Fiber optic cable
- Satellite
- Microwave
- Wireless

# Data Communication

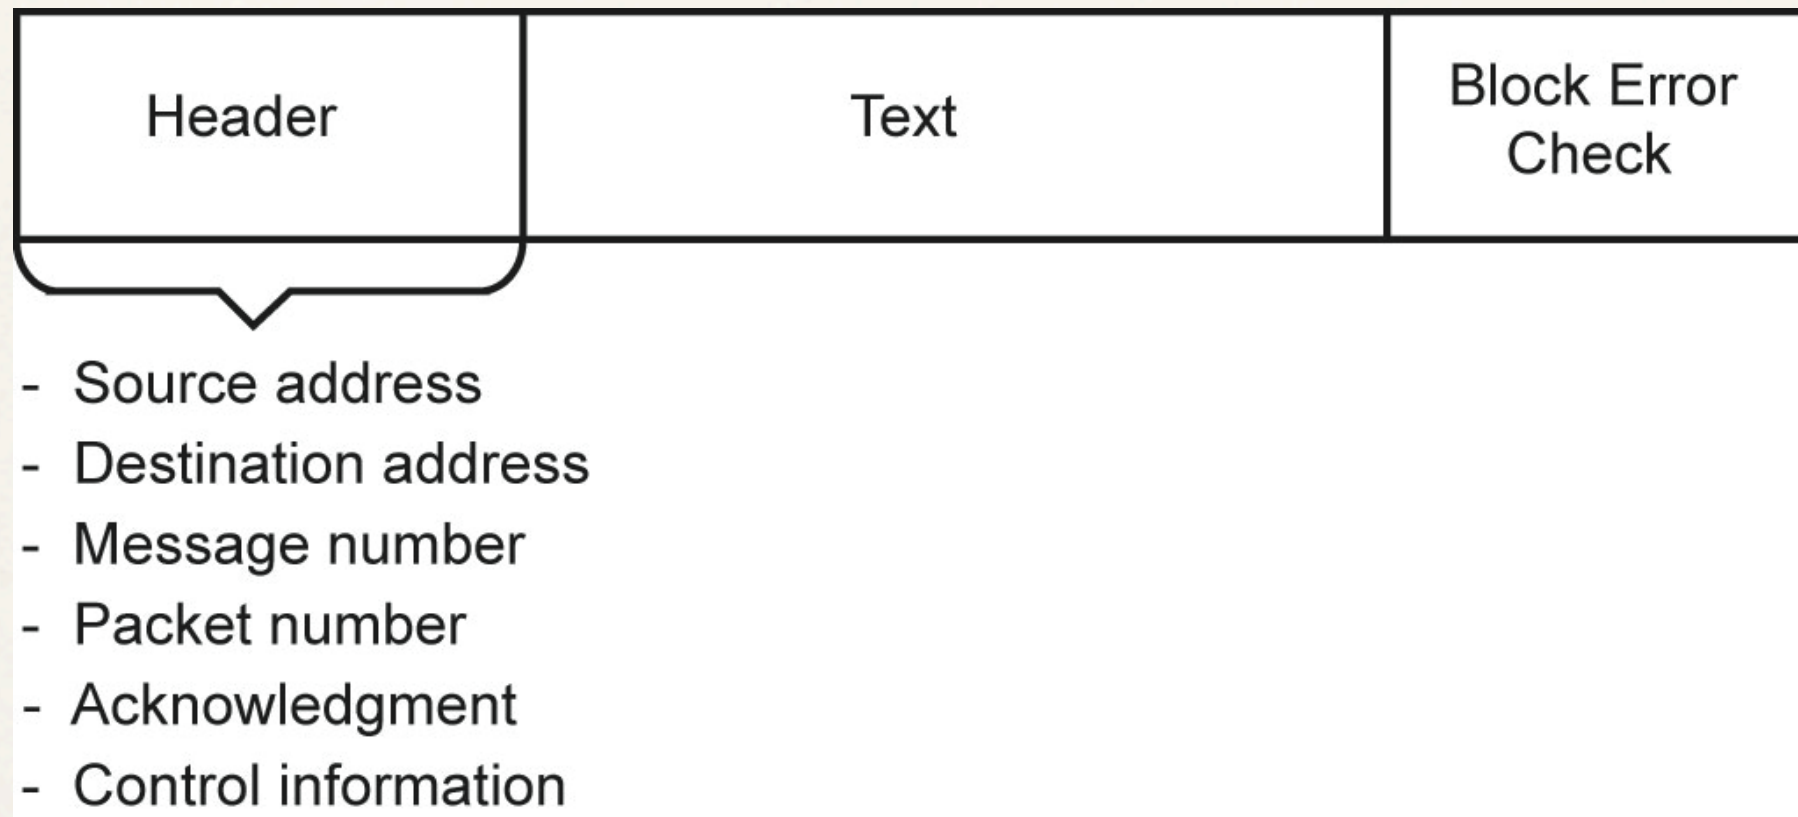

---

- Hosts are connected by **links**, each of which can carry one or more **channels**
- Link: physical entity; channel: logical entity
- Digital signal versus analog signal
- Capacity – bandwidth
  - ➔ The amount of information that can be transmitted over the channel in a given time unit
- Alternative messaging schemes
  - ➔ Packet switching
    - ◆ Messages are divided into fixed size packets, each of which is routed from the source to the destination
  - ➔ Circuit switching
    - ◆ A dedicated channel is established between the sender and receiver for the duration of the session

# Packet Format

---

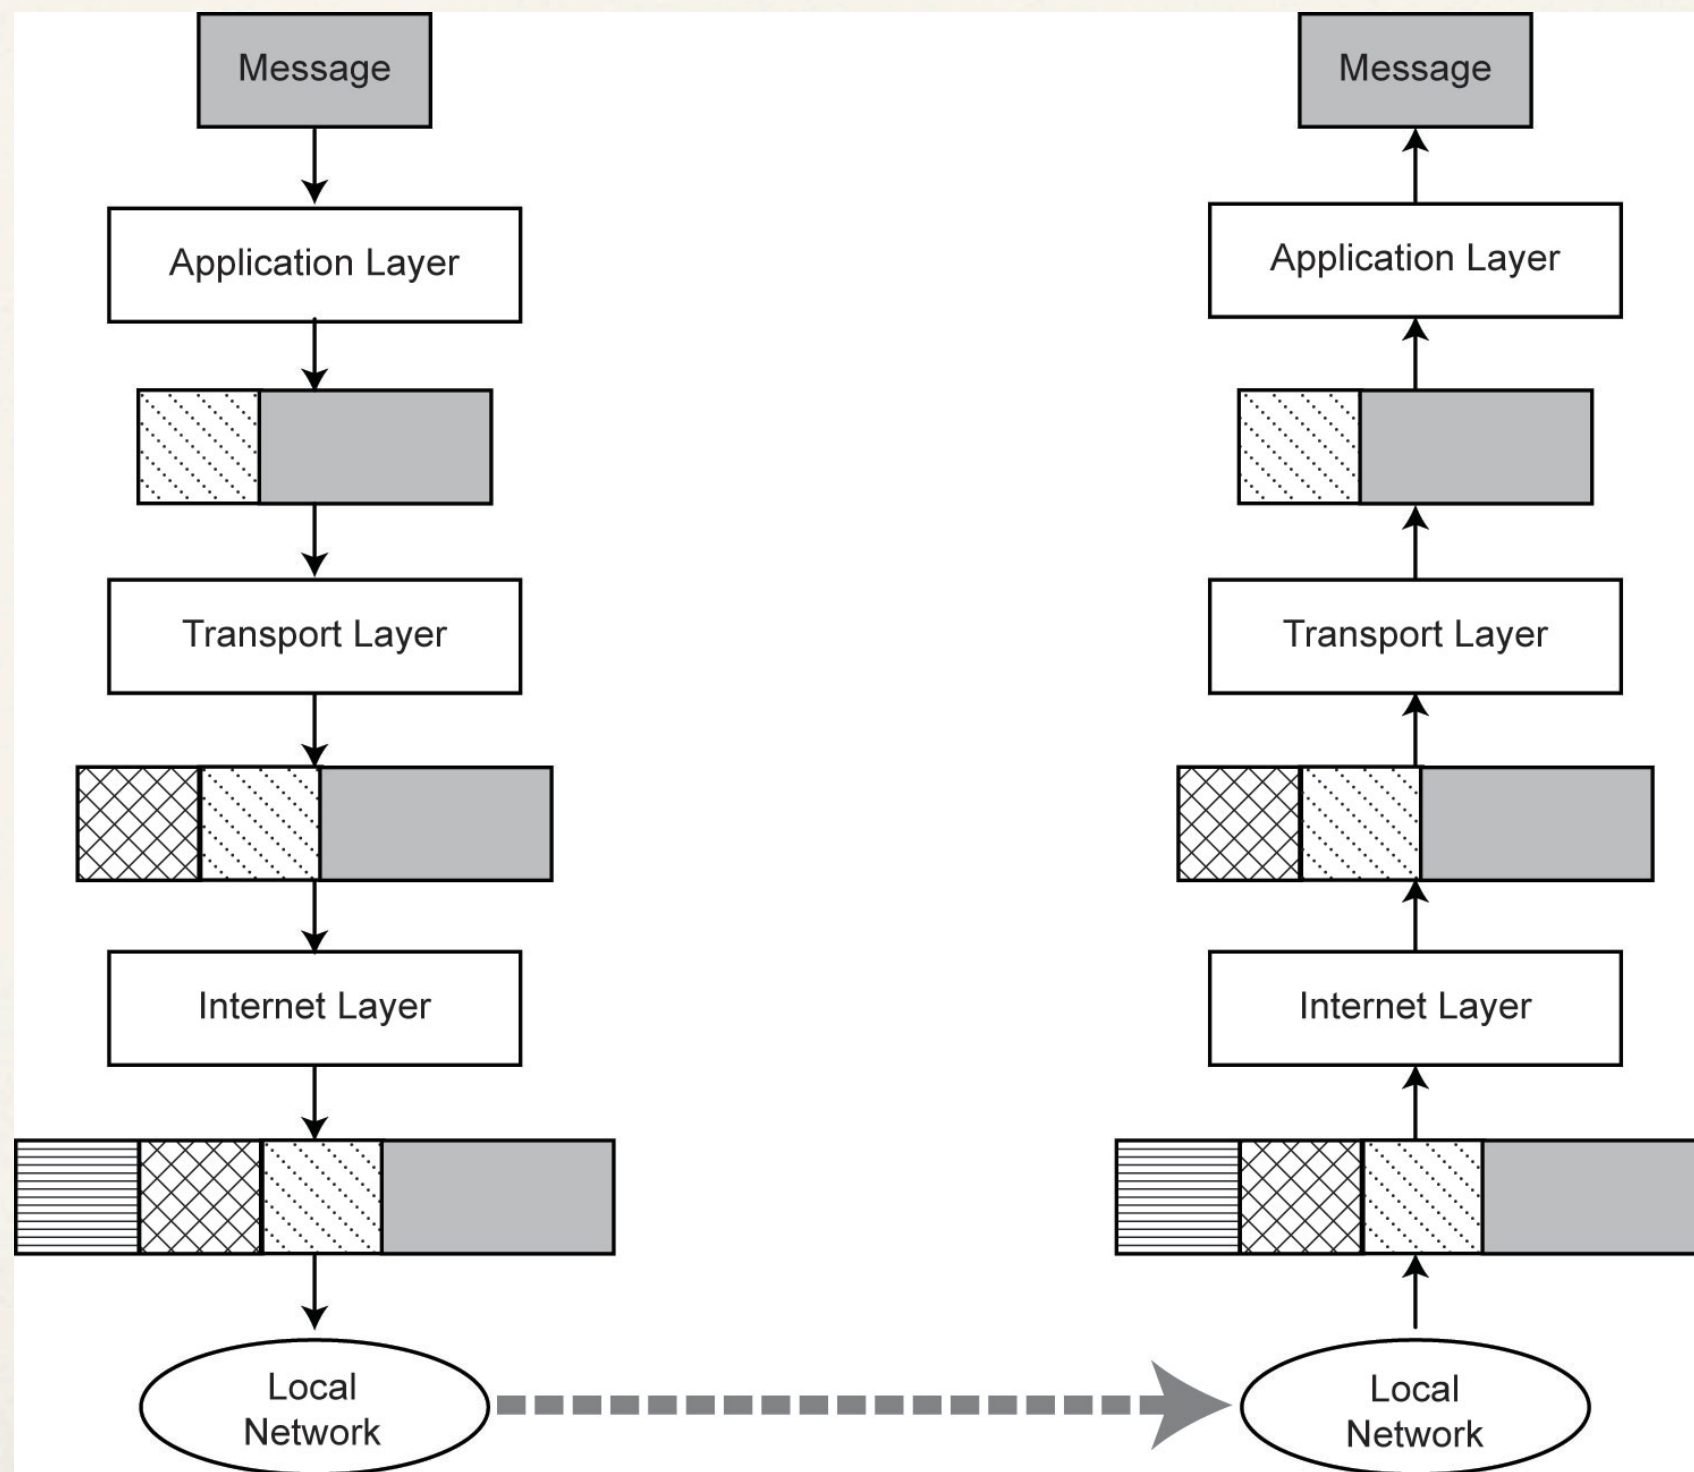

# Communication Protocols

---

- Software that ensures error-free, reliable and efficient communication between hosts
- Layered architecture – hence protocol stack or protocol suite
- TCP/IP is the best-known one
  - ➔ Used in the Internet

# Message Transmission using TCP/IP

# TCP/IP Protocol
