

Algorithm and Data Structure Analysis (ADSA)

Lecture 8: Priority Queues
(Book Chapter 6)

Heaps

- A *heap* can be seen as a complete binary tree:

- *What makes a binary tree complete?*
- *Is the example above complete?*

Heaps

- A *heap* can be seen as a complete binary tree:

- The book calls them “nearly complete” binary trees; can think of unfilled slots as null pointers

Heaps

- In practice, heaps are usually implemented as arrays:

Heaps

- To represent a complete binary tree as an array:
 - The root node is $A[1]$
 - Node i is $A[i]$
 - The parent of node i is $A[i/2]$ (note: integer divide)
 - The left child of node i is $A[2i]$
 - The right child of node i is $A[2i + 1]$

$A =$

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

 $=$

Referencing Heap Elements

- So...

```
Parent(i) { return [i/2]; }
```

```
Left(i) { return 2*i; }
```

```
right(i) { return 2*i + 1; }
```

- An aside: *How would you implement this most efficiently?*
 - Trick question, I was looking for “ $i \ll 1$ ”, etc.
 - But, any modern compiler is smart enough to do this for you (and it makes the code hard to follow)

The Heap Property

- Heaps also satisfy the *heap property*:

$$A[\textit{Parent}(i)] \geq A[i] \quad \text{for all nodes } i > 1$$

- In other words, the value of a node is at most the value of its parent
- *Where is the largest element in a heap stored?*

Heap Height

- Definitions:
 - The *height* of a node in the tree = the number of edges on the longest downward path to a leaf
 - The height of a tree = the height of its root
- *What is the height of an n -element heap?*
Why?
- This is nice: basic heap operations take at most time proportional to the height of the heap

Heap Operations: Heapify

- **Heapify()** : maintain the heap property
 - Given: a node i in the heap with children l and r
 - Given: two subtrees rooted at l and r , assumed to be heaps
 - Problem: The subtree rooted at i may violate the heap property (*How?*)
 - Action: let the value of the parent node “float down” so subtree at i satisfies the heap property
 - *What do you suppose will be the basic operation between i , l , and r ?*

Heap Operations: Heapify

```
Heapify(A, i)
{
    l = Left(i); r = Right(i);
    if (l <= heap_size(A) && A[l] > A[i])
        largest = l;
    else
        largest = i;
    if (r <= heap_size(A) && A[r] > A[largest])
        largest = r;
    if (largest != i)
        Swap(A, i, largest);
    Heapify(A, largest);
}
```

Heapify Example

$A =$

16	4	10	14	7	9	3	2	8	1
----	---	----	----	---	---	---	---	---	---

Heapify Example

$A =$

16	4	10	14	7	9	3	2	8	1
----	---	----	----	---	---	---	---	---	---

Heapify Example

Heapify Example

$A =$

16	14	10	4	7	9	3	2	8	1
----	----	----	---	---	---	---	---	---	---

Heapify Example

$A =$

16	14	10	4	7	9	3	2	8	1
----	----	----	---	---	---	---	---	---	---

Heapify Example

Heapify Example

$A =$

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

Heapify Example

$A =$

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

Heapify Example

$A =$

16	14	10	8	7	9	3	2	4	1
----	----	----	---	---	---	---	---	---	---

Analyzing Heapify: Informal

- *Aside from the recursive call, what is the running time of **Heapify()**?*
- *How many times can **Heapify()** recursively call itself?*
- *What is the worst-case running time of **Heapify()** on a heap of size n ?*

Analyzing Heapify: Formal

- Fixing up relationships between i , l , and r takes $\Theta(1)$ time
- *If the heap at i has n elements, how many elements can the subtrees at l or r have?*
 - Draw it
- Answer: $2n/3$ (worst case: bottom row $1/2$ full)
- So time taken by **Heapify** is given by $T(n) \leq T(2n/3) + \Theta(1)$

Analyzing Heapify: Formal

- So we have

$$T(n) \leq T(2n/3) + \Theta(1)$$

- By case 2 of the Master Theorem,

$$T(n) = O(\lg n)$$

- Thus, **Heapify** takes logarithmic time
